Project Name	AI based discourse for Banking Industry

Creating Assistant & Integrate With Flask Web Page

Let us build our flask application which will be running in our local browser as an user interface.

In the flask application, users will interact with the chat bot, and based on the user queries they will get the chatbot responses.

Building Python Code

1: Importing Libraries

The first step is usually importing the libraries that will be needed in the program.

```
from flask import Flask, render_template
```

Importing the flask module into the project is mandatory. An object of the Flask class is our WSGI application. Flask constructor takes the name of the current module (name).

2: Creating our flask application and loading

```
app = Flask(__name__)
```

3: Routing to the Html Page

Here, the declared constructor is used to route to the HTML page created earlier.

The '/' route is bound with the bot function. Hence, when the home page of a web server is opened in the browser, the HTML page will be rendered.

```
@app.route('/')  
def bot():  
    return render_template('chatbot.html')
```

Main Function

This is used to run the application in local host.

```
if __name__ == '__main__':  
    app.run()
```

Building HTML Code

We have used HTML to create the front-end part of the web page.

Here, we have created “index.html” displays the home page which gets integrated with Watson Assistant.

Auto-generated source code which contains the Integration ID of IBM Watson Assistants is copied and pasted inside the body tag.

Run the application

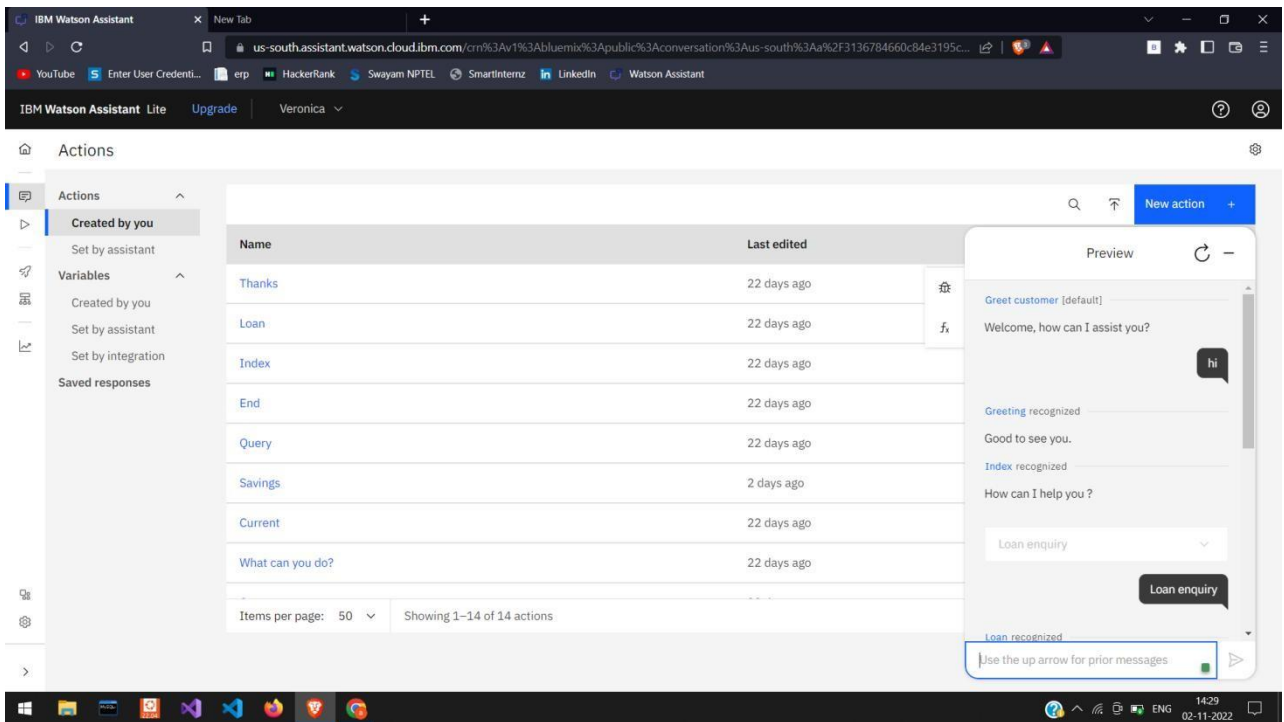

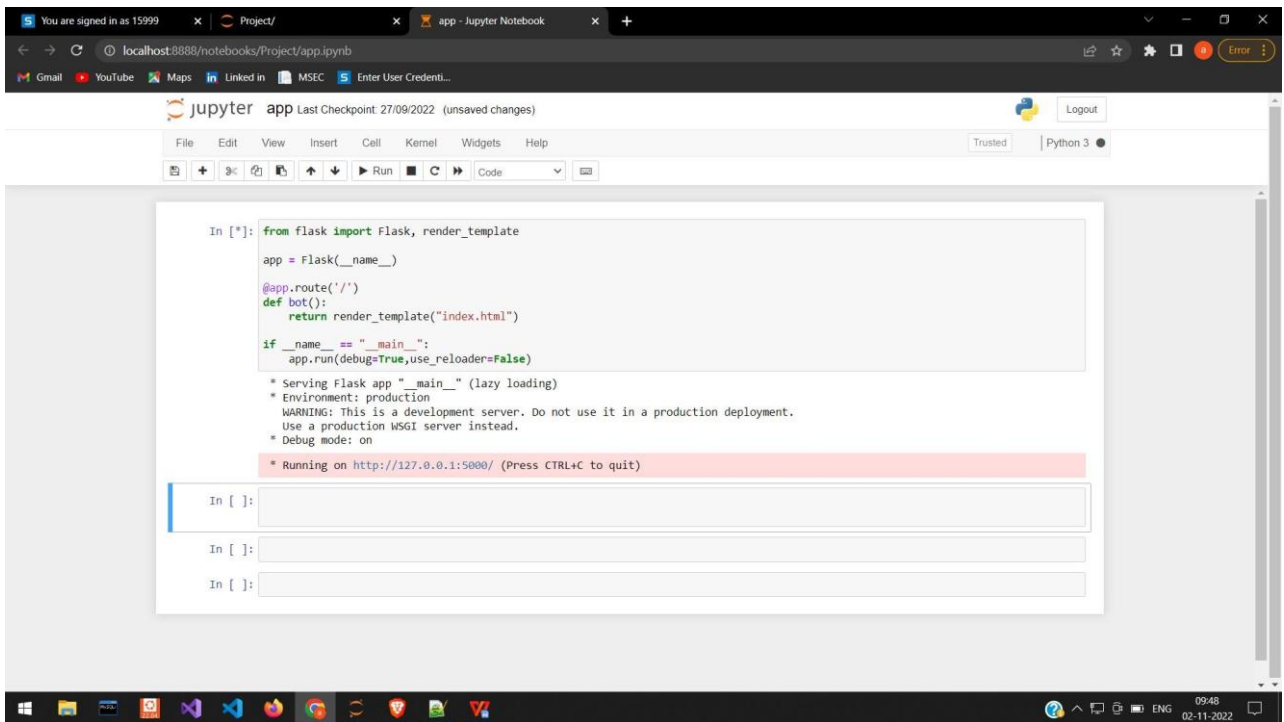

Open Jupyter notebook (anaconda3)

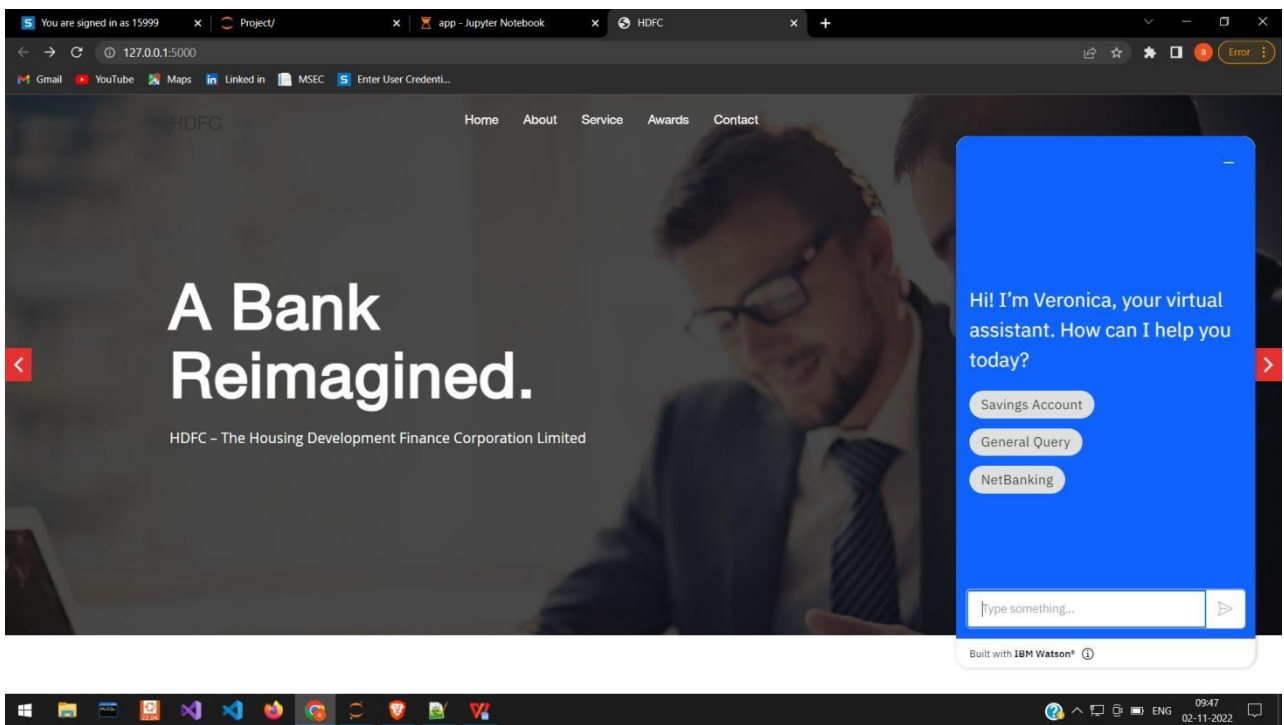

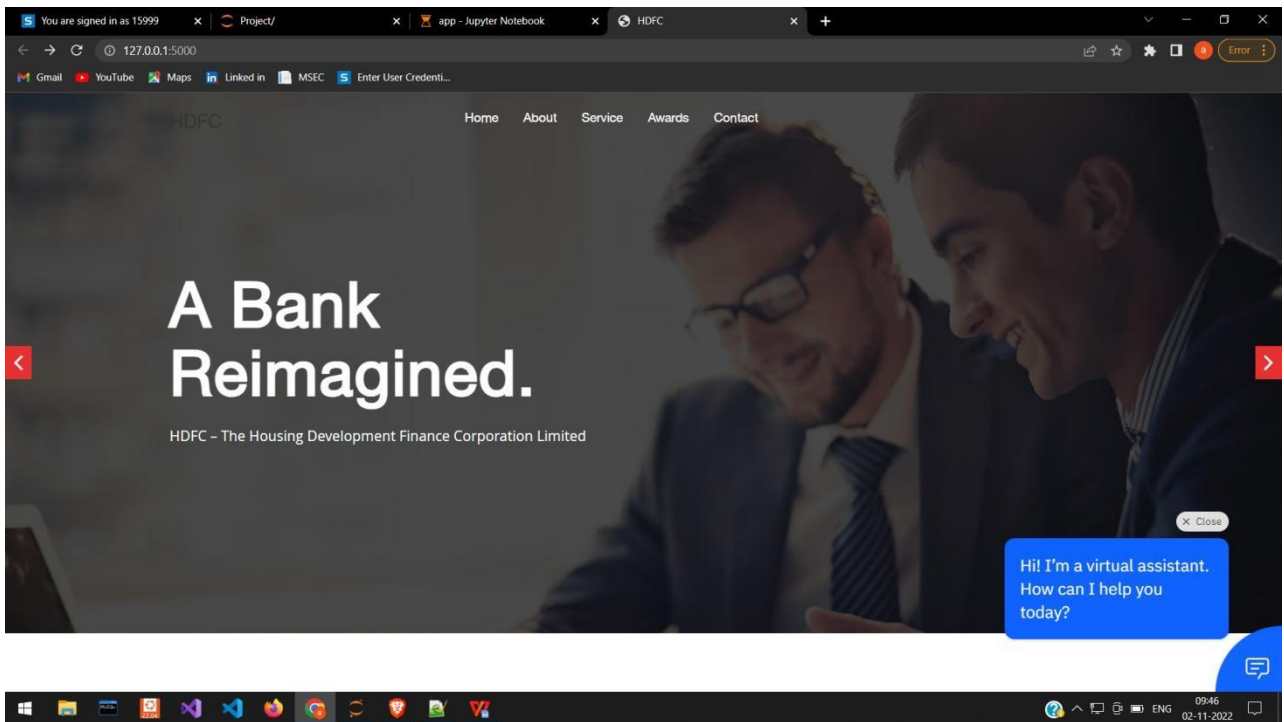

Navigate to the folder where app.ipynb resides.

Run the python code

Open a browser and type this URL <http://127.0.0.1:5000/>

It launches the application integrated with IBM Watson Assistant.
